Dragging Destroys Grasshopper Eggs

While millions of grasshoppers have been killed by polsoning, and probably like number have died because of the parasites and diseases which attack the hoppers, there still are plenty of them that will lay a sufficient number of eggs to produce a bumper crop of them again next vear.

An effective means of controlling these pests on some fields is to wait until the middle of September and drag and plow all old sod lands, thus either destroying or burying the eggs. Even sod lands having stumps can be dragged in and around the stumps, and although it means harder work, will remove the possibility of grasshoppers hatching out over most of the field. Another good thing about this system of control is that by breaking of much of the old sod land and re-seeding, preferably to alfalfa, much larger yields of hay and pasture will be secured.
