January 1, 1925.

Mr. Wm. G. Mather, Pres.,

Cleveland, Ohio.

Dear Sir:-

I regret exceedingly that on account of Mr.Duncan's illness he is unable personally to forward to you report of the operations of the Mining Department for the year 1924. The inventories, maps, and statements relative to this report have gone forward under separate cover.

The colored portions of the maps show the work for the year. The reports of the different mines of the Company were made by the Superintendents in charge and the reports of the Mechanical, Engineering, Geological, Safety, and Welfare Departments by the heads of these departments.

Due to the decrease in sales and the large amount of ore in stock at the majority of the Company's mines, it was decided by you to reduce the working time, effective August 1st, to four days per week. On account of the demand for Cliffs Shaft Ore, this mine was only reduced to five days; the Barnes-Hecker being in the development state continued to work at full time, two shifts, with the exception that no work was done on Saturday night. On December 1st you gave instructions to put all mines which had been on a curtailed basis on five days.

The following condensed statement shows a comparison of all

of the Company's mines for 1924, as compared with 1923:

	1.17.2	Tons Per Man	Cost on Cars.	Avg.Rate Pr.Day	LaborCost Per Ton	Taxes
1923	3,108,507	3.83	\$2.486	\$4.91	\$1.282	\$.328
1924	2,899,245	4.00	2.501	5.11	1.279	.345
	209,262	.17	.015	.20	.003	.017

I call your attention to the fact that the efficiency, even on the reduced tonnage, has not decreased. The small increase in the cost on cars is explained by the increase in the cost for taxes. The cost per ton for taxes is naturally higher with the smaller tonnage. The labor cost per ton shows a slight decrease, although wages show an increase.

The only outstanding lease is to the Empire Iron Company, covering the E_2^{\perp} of the ST $\frac{1}{4}$ and the T_2^{\perp} of the ST $\frac{1}{4}$ of Section 19-47-26.

M. M. Buceau Vice Fres. & Gen. Mgr. By Milliely

General Superintendent.

ANNUAL REPORT

OF THE

CLIFFS SHAFT MINE

(1924)

PRODUCTION AND SHIPMENTS.

The Cliffs Shaft Mine worked 277 days in 1924, and produced 296,508 tons of ore, an average of 1,070 tons per day. On February 23rd and on four Saturdays in March the mine was closed for want of electric power. Beginning August 1st and continuing to the end of the year the mine worked five days a week single shift. There was no shortage of labor at any time during the year. The efficiency was increased by the greater use of scrapers and the installation of five-ton cars underground and by minor changes in chutes and pockets on surface.

14,116 tons of rock were produced, all of which was dumped underground.

Shipments to the dock started on April 22nd and closed on November 26th. Shipments from stock-pile were large, and the book-balance of ore on hand was less than in 1923. There is, however, a substantial overrun in the stock-piles, which has accumulated from year to year.

CLIFFS SHAFT MINE.

·· 9

There was no shortage of labor at any time except in May and June. During these months some good men left to start work on their farms.

> After August 1st the mine was operated five days a week. There were no changes in the wage-scale during the year.

POWER.

LABOR.

The mine was closed on February 23rd and on four Saturdays in March, the 8th, 15th, 22nd and 29th, on account of shortage of water for electric power. The steam-driven air-compressor was used during this period.

The main boiler-plant was shut down on June 1st, and was started again on November 1st, the small boiler in the dry being used in the interim.

FATAL ACCIDENT. JOSEPH HARRINGTON.

At 7:55 A.M. January 28th, while the locomotive on the tenth level in "A" shaft was pushing in a train of empty cars, one of the bundles of drill-steel, that were being carried by the locomotive, rolled over the side, tilted up, and was pushed back over the rear end. It struck the brakeman, Joseph Harrington, who was riding on the rear of the locomotive, in the chest, and knocked him off. The blow caused a rupture of the lower intestines, which resulted in peritonitis, and he died during the night of the following day. He was a single man, 33 years old, and had worked at the mine for eight years.

The mine was closed for half a day on Saturday, February 2nd, for the funeral.

10

.

ACCIDENTS TO EQUIPMENT.

SHEAVE.

At 4:15 P.M. on March 18th the pillow-blocks on the turn-sheave of "A" shaft hoisting rope gave way, and the sheave was jammed up against the concrete beams in the shaft-house. New pillow-blocks and a new sheave were on hand, and were erected that night, so that there was no loss of product.

SCRAPER-HOIST.

On April 11th the electric scraper-hoist on the first level in "B" shaft was entirely demolished by a large chunk of ore, which rolled over the pocket. It was almost a total loss, but was rebuilt, and another motor was obtained.

AIR-PIPE.

The main air-pipe blew out at a joint near "A" shaft on the morning of September 23rd, and this shaft was idle for $1\frac{1}{2}$ hours.

PUMPING MACHINERY.

The centrifugal pump broke both shafts early in the year, and was sent to surface and thoroughly repaired. It was put back into service on April 9th.

NEW CONSTRUCTION.

E AND A. 444. FIRE PROTECTION.

Fire-doors have been erected at strategic points on the different levels so that the air-circulation between the shafts can be stopped, and another door has been erected at the foot of the raise from the Incline Mine, so that the down-cast draft can be stopped. These have been connected to air-lines, so that they can be simultaneously closed by opening an air-valve on any level in each shaft or on surface. A stench signal-system for use in case of fire underground has also been installed, and proper notices prepared. The program called for by this E. and A. has not been entirely completed, as the hose and water connections are not entirely completed, and some of the signs have not been received.

E AND A. 448. STEEL ORE-CARS.

This E and A. was started in 1923, and called for the purchase of sixteen steel, rocker-dump, five-ton ore-cars for the fifteenth level. Certain changes in chutes, pockets and tracks were necessary, and there were nearly all made last year. The cars were delivered in March and April, and the first ten were put in service on April 1st.

As a result two less men were required on this level, the overrun was increased, and hoisting capacity from this level was increased from 60 to 100 tons per hour. All the ore on the fifteenth level is now hoisted through "B" shaft.

E AND A. 453. SIX SCRAPER HOISTS AND CABLES.

As the full capacity of the air-compressors had been reached, it was decided to drive new scraper-hoists by electricity. A system of power distribution was laid out, and six scraper-hoists with 25 H.P. motors were designed and purchased, and the necessary cables, junction-boxes, etc. were purchased and installed. Five of the new hoists are now in service, and some of the air-driven hoists have been electrified.

ELECTRIC HAULAGE.

The trolley locomotive on the eighth level in "A" shaft went into commission in March, taking much of the ore that formerly went to the tenth level, and reducing the cost of handling. The proportion of lump ore was also increased by reducing breakage in the chutes.

The storage-battery locomotive from the Salisbury Mine was sent to the Cliffs Shaft Mine in July, and the gauge was widened to 24 inches. It was sent down to the sixth level in "A" shaft for experimental work in connection with a scraper-slide.

ROCK DRILLS.

Nine more No. 18 Ingersoll Leyner drills were replaced by No. 248 drills of the same make during the year, and comparative tests were made with some other makes of drills.

EXPLORATION.

UNDERGROUND DIAMOND DRILLING.

Eighteen diamond drill-holes were drilled during the year, a detailed description of which is given in the geologist's annual report.

In "A" shaft on the eleventh level in the Main Vein two holes were drilled to the north, and two to the south, and from the east end of the level one was drilled to the east and two to the north-east. These holes were successful in finding ore to the north and east, but no ore was found to the south. Two holes were drilled east and north-east from the east end of the twelfth level in the same vein without finding ore.

The drill was then moved to the South-East Deposit, where two holes were drilled on the fifth level, one due south, 1150 feet south-east of the shaft, which found thirty feet of ore, and one north-east, 1480 feet southeast of the shaft, which found ore under the hanging-wall.

The drill was then moved to the east end of the seventh level below the workings of the Incline Mine. Here two holes were drilled horizontally to the north-west and north-east. As it was evident that these holes were in the foot-wall, the drill was turned around, and a hole was drilled south-west at an inclination of thirty degrees up, which cut nine feet of ore at 69 feet, and then went into the hanging-wall.

The drill was moved back to the South-East Deposit, where two holes were drilled to the south without finding ore on our side of the boundary line. A third hole is being drilled to the north. All holes but one have been horizontal, and all have been in "A" shaft.

SURFACE.

There was no important new construction on surface, but repairs to buildings and equipment were not neglected. The roads were fixed up, and the wall around the drive-way at the office was repaired and concrete steps were built on the west side.

At the pocket an old electric timber-hoist from the Lake Mine was erected to move pocket-cars on the lump ore track in the winter-time. CLIFFS SHAFT MINE. Cars are spotted in summer by small air-hoists.

STOCK-PILES.

A new car for stocking lump ore was built in January, and its use materially increased hoisting capacity.

Both lump and crushed ore stock-piles were substantially reduced during the summer, and estimated overruns in both piles were reported by the engineers, the overrun in the lump pile being considerably larger than last year.

One of the trestles erected in 1923 for lump ore was not disturbed by loading operations, and ore was stocked from this trestle until the end of the year. Another trestle was erected and a third started. No trestle is used in stocking crushed ore.

A car of trestle legs was received in September.

BUILDINGS.

A new roof was put on the Central Chemical Laboratory, and the inside of the shops, drill-shop and dry was painted.

FINE CRUSHER.

The fine crusher was put in operation on May 22nd, and was operated intermittently throughout the season. 11,851 tons of Cliffs Shaft Crushed and 14,629 tons of Holmes and Holmes Bessemer were crushed to fill special orders.

EQUIPMENT.

Three wooden tram-cars were built for the fifth level, and four steelbodied cars were built as an experiment.

A 3600-gallon oil-tank was purchased and erected, the saving on a car of oil more than paying for the installation.

· 1A

One scraper-hoist was entirely rebuilt, two Lidgerwood hoists were electrified for use with scrapers, and one air-hoist was electrified and erected on the second level in "A" shaft for handling cars on the rock-dump.

Two skips were rebuilt during the year, and a new rope was put on in "B" shaft.

A portable scraper-slide for loading cars underground with a scraper was built in the shops, and a permanent slide for the same purpose was erected underground.

SCRAP.

A scrap-yard for the collection, sorting and reclamation of scrap from the mines of the district is maintained, and a large amount of scrap was collected, much of it coming from the Salisbury Mine. Six and a half cars of scrap of various grades were sold during the season.

UNDERGROUND.

GENERAL.

At the beginning of the year there were 50 contracts working, evenly divided between the shafts, but in October and November a number of changes were made, so that there were 31 contracts in "A" shaft and 19 in "B" shaft. This was done, because the ore-reserves in "A" shaft are nearly twice as large as those in "B" shaft. In order to equalize the hoist all the ore mined below the tenth level in "A" shaft is trammed to "B" shaft on the fifteenth level, and hoisted there.

The average classification and distribution of contracts for the year is as follows:-

	"A" Shaft	"B" Shaft	Total
Stopes	10	9	19
Floors	9	8	17
Backs	1	1	2
Ore-Drifts and Raises	3	4	7
Rock	_3	<u>_1</u>	_4
Total	26	23	49
Developing New Ore	12	10	22
Mining Known Reserves	11	12	23
Rock	_3	<u>_1</u>	_4
Total	26	23	49

DEVELOPMENT.

"A" SHAFT.

In the North Vein the principal development has been at the east end of the sixth level, and on the eighth level underneath the sixth level deposit. One gang is stoping north on the sixth level, 1950 feet north-east of the shaft, but have not yet reached the foot-wall, and another is stoping east near the hanging-wall, 2150 feet north-east of the shaft. The ore in this part of the vein is now known to be 350 feet long and 200 feet wide at its widest point with actual limits undetermined, and there is a good chance that it will connect with ore on the fifth level of No. 3 Wine 550 feet north-east. Underneath this ore a stope is being driven east on the eighth level and a raise is being put up. The width of the ore is undetermined here also.

On the fifth level the stope that was going west, 800 feet northwest of "A" shaft, was continued west about 100 feet, but the ore pinched out. There is good ore in both back and floor, however, and a contract just below the sixth level in "B" shaft has cross-cut the ore below the middle of the stope.

On the seventh level another raise was put up at the west end of the drift 900 feet north-east of the shaft, and one gang has been stoping and drifting to the east following an irregular vein from 1500 to 1600 feet northeast of the shaft.

In the Main Vein some exploratory drifts and raises have been driven on the seventh level at the east end in an endeavor to locate the extension of the ore below the bottom of the Incline Mine, but this work has been disappointing. The ore is now being followed to the south.

The most important development in this vein has been on the eleventh and twelfth levels. The east end of the ore was reached on the eleventh level, and a raise was put up to the tenth level on the south foot-wall near the middle of the vein. Two branch-raises were also put up to different stopes on this level. One contract is now following the north part of the vein to the east. On the twelfth level stopes have been driven west and north, and the ore is now known to be at least 360 feet long and 160 feet wide at its widest point. The width has not been determined at all points.

In the South-East Deposit the development campaign started last year was continued. Two gangs are working above the fifth level. One is stoping east in fine ore on the fourth level, but the back is weak. Another apparently reached the end of the ore on the west on a sub-level ten feet below the fourth level, where the ore pitched down to the west. No work was done on the fifth level, except diamond drilling, and a short rock drift, but two veins of ore were cut by drill-holes. On the sixth level the ore was followed to the east, but it was very irregular and was cut up by rock, and little tonnage was blocked out. The vein on this level is 870 feet long. On the seventh level some stoping was done and three raises were put up to the sixth level in the west part of the vein, and a stope was driven east during most of the year. This ore pinched out, and a rock-drift is being driven east to reach a raise that was put up in ore from the ninth level.

On the ninth level 1550 feet south-east of "A" shaft a cross-cut stope has been driven to the south through ground that was considered too poor to mine,

and some good ore has been found, although it is often badly mixed with rock. A drift started in rock on the tenth level under this ore-body was in good ore in December.

In the South Lens a rock drift was driven west on the fifth level and a raise put up 400 feet south of the shaft to make available for mining the floor of a stope on the third level.

"B" SHAFT.

In the North Vein there has been no development, except the cross-cut on a sub-level just below the sixth level, which cut the ore found on the fifth level, 800 feet north-west of "A" shaft.

In the Main Vein the ore just below the fifth level, 500 feet west of "B" shaft, has been followed east an unexpected distance, but the end is not far off. There was no development below this level till the twelfth level is reached, where two gangs have opened up and mined a fair tonnage of ore under the hanging-wall near the north side of the deposit. Two raises have been put up near the hanging-wall in the west part of the fourteenth level, but the ore is thin here. On the fifteenth level the main drift is being extended to the north-west to reach the ore found by diamond-drilling.

'In the Fault Vein the ore has been followed west on the fourteenth level to the end, 1620 feet west of "B" shaft, and cross-cuts are now being driven to the hanging to determine the width. The fifteenth level drift was extended and two raises were put up to this vein, and four have been put up from the fourteenth to the thirteenth level. Three of these have been put through to the twelfth level and one to the eleventh. This vein is being prepared for underhand stoping, and when all the raises are up a large tonnage can be handled cheaply.

In the South Lens above the first level, 800 feet south-east of the shaft a bench raise is being put up to make available some ore on the 1190 foot sub-level under the hanging-wall.

STOPING.

"A" SHAFT.

The policy started some years ago of cleaning up small, scattered reserves of ore on the upper levels and concentrating reserves in the larger ore-bodies on the lower levels has been continued as far as the maintenance of the requisite number of working places would allow. In addition it has been endeavored to keep half the contracts in advancing work on new ore, as in a mine of this character a contract on advancing work on the average develops nearly as much ore as it takes out. If this policy is maintained the estimated ore-reserves will show only a small annual shrinkage.

On the second level in "A" shaft one gang has been stoping on a sublevel under the first level in the Main Vein, 730 feet north-west of the shaft. The ore has been very irregular in both size and analysis. Another gang has been mining 130 feet further east for six months, dropping their ore directly into a chute. 600 feet east of the shaft two gangs have been mining the floor of the second level, following the ore downwards to the east. At the end of the year this place was looking better than for some time previous.

In the North Vein one gang has been mining the floor of the second level 430 feet north-east of "B" shaft most of the year, the ore going to the fifth level in "A" shaft, and another has been stoping on a sub-level 500 feet north-west of "A" shaft. This ore is narrow and irregular. There have been four gangs mining the floor of the sixth level from 900 to 1450 feet north-east of the shaft most of the year, and they have enough ore left in this territory to last for another year or more.

Another gang has finished the floor of the ninth level 1500 feet northeast of the shaft and is now cleaning up small amounts of ore left around the same raise on the seventh and eighth levels.

In the Main Vein there was no stoping done during the year, except that described under "Development."

In the South Lens one gang has been cleaning out the tail-end of an

ore-body above the third level 300 feet south of the shaft, another has finished the ore above the fifth level, 550 feet south-east of the shaft, and a third has finished the ore in this deposit between the eighth and ninth levels 600 to 700 feet south-east of the shaft. Another gang mined the floor of the eighth level from 800 to 1220 feet east of the shaft, and is now starting on the floor of the ninth level 1030 feet south-east of the shaft. The available ore in this deposit is pretty well cleaned up as far down as the ninth level, a little remaining on the fourth and sixth levels only.

"B" SHAFT.

On the sub-levels above the first level four gangs have been mining floors all year. One is mining the floor of the 1204 foot sub-level at the head of the raise 450 feet south-west of "B" shaft, and has come nearly to the end of the ore. Another is mining the floor of the 1190 and 1204 foot sublevels 100 feet further east. This place is looking very well. A third has mined the floor of the 1190 and 1200 foot sub-levels 500 and 600 feet southeast of the shaft, and is now extending the 1165 foot sub-level further east in rock before continuing their stoping operations. The fourth gang mined the floor of the 1220 foot sub-level 700 to 750 feet south-east of the shaft, and is now putting up a branch raise to mine the floor of the 1190 foot sub-level.

In the Main Vein one gang finished the ore available in the floor of the third level from 300 to 400 feet south-east of the shaft, and moved to "A" shaft in November. Another has nearly finished the ore left in the floor of the tenth level 700 to 860 feet north-west of the shaft, and another has mined the ore in the back of the thirteenth level. Another gang has mined the ore between the thirteenth and fourteenth levels near the hanging-wall on the north side of the fourteenth level drift. Another gang has stoped to the west on the thirteenth level following the south edge of the vein to the end, 1450 feet west of the shaft. Other operations in this vein have been described under "Development."

20

In the North Vein one gang has mined nearly all the ore above the fifth level around a raise 600 feet north of the shaft. On the sub-level below the sixth level the floor of the sixth level 400 to 500 feet north of the shaft has been finished by two contracts. One gang is starting to mine the floor of the sub-level.

In the Fault Vein two gangs are mining the floor of the eighth level from 1150 to 1300 feet south-west of the shaft. One of these gangs mined the floor of the seventh level from 1000 to 1200 feet south-west of the shaft during most of the year. The ore in this vein is finished down to the eighth level, except for a small amount of floor left on the seventh level.

1923	\$	33715.08	\$.116
1924		33040.20	-	.111

In 1923 the diamond drill was operated three months, while in 1924 the drill was in operation throughout the year.

The decrease is due to 22 less working days and to less raising and drifting in ore.

The decrease is due to 22 less working days in 1924.

The increase is due to employing two extra timbermen the greater part of 1924.

The decrease is due to 22 less working days and fewer trammers employed.

1924 charges are for installing fire-doors and air and waterlines for fire protection, E & A. 444.

The decrease is in consumption of electric power, on account of less water pumped.

The cost of operating compressors decreased \$ 1134 in 1924, on account of 22 less working days. Air-pipes cost \$ 3496 in 1923 and \$ 3955 in 1924, an increase of \$ 459.

UNDERGH	ROUN	D COSTS.	(Cont:	inued)
Back Filling	£•			and N.

1923	\$	895.96	\$.003
1924		3673.84		.013
Increase	\$	2777.88	\$.010

The increase is due to more men employed handling rock.

In 1924 an extra shift-boss was employed from July 1st.

In 1923 14 - No. 248 Leyner-Ingersoll drills cost \$ 5115.25, while in 1924 9 drills of the same type cost \$ 3381.54.

The increase is due to a larger number of scrapers in use. Three new scraper-hoists cost \$ 1930.72 in 1924.

The increase is due to charging off E & A. 448, 16 steel, rocker-dump, five-ton ore-cars for fifteenth level "B" shaft.

The increase is due to rewiring pump-house and overhauling centrifugal pump.

SURFACE COSTS.

1923	\$	4008.83	\$.014
1924	1.	2056.50	.007
Decrease	\$	1952.33	\$.007

The increase is in repairs to screens and chutes.

The decrease is in heating charges.

The increase is due to repairing the wall around the driveway at the office and building concrete steps on the west side of the wall.

In 1923 two Lilly Hoist Controls cost \$ 2199.

In 1924 both shafts were relined with new casing plank.

Motors decreased \$ 439 including part payment on a new motor in 1923. Tracks and cars decreased \$ 204 and wire-rope increased \$ 88. Repairs to rollers increased \$ 80.

Grading and planking cost \$ 141 in 1923. There was no charge to this account in 1924.

The decrease is in repairs to the coal-dock.

Decrease	\$	493.75	\$.003

This is a Central Office charge.

The increase is due to fatal accident to Joseph Harrington.

The decrease is largely supplies. In 1923 fire-extinguishers and buckets cost \$ 100, bulletin boards and signs \$ 88, and firehelmets \$ 500.

Charges at the mine decreased \$ 954, the principal items of decrease being,

Janitor, Heat, Etc.	\$ 481
Telephone	27
Garage and Mileage	440

Direct charges increased \$ 458.

ANNUAL REPORT OF THE

SALISBURY MINE

(1924)

1.1. S. A.

PRODUCTION AND SHIPMENTS.

The Salisbury Mine worked 141 days in 1924, and produced 54,389 tons of ore of all grades, an average of 386 tons per day. The mine was closed down on July 1st and abandoned, and the men were transferred to the Barnes-Hecker and other mines. All underground equipment was removed, and nearly all of the buildings on surface were torn down or sold.

All the ore in stock was shipped.

Factors Used: -

Bessemer and Clinton in Place:- 12 cu. ft. per ton. Silica:- 13 - 15 cu. ft. per ton.

The ore-bodies had become so small that the mine was unprofitable, and there is not enough ore in sight or in prospect to warrant reopening it. LABOR.

The mine was started on full schedule on January 8th with seventeen contracts working double-shift. There were a dozen gangs cleaning up and starting to break ore for a week previous, but there was no night shift. The mine was closed down on July 1st, and most of the underground men were transferred to the Barnes-Hecker Mine. Some were transferred to the Holmes and Cliffs Shaft Mines, and all single men were laid off. A small crew was retained till early in September tearing down old buildings, loading mine timber, coal, etc.

There was no shortage of labor of any importance.

MINING CAPTAIN.

Captain J.H. Dunstan retired on account of ill-health on January 31st, and Captain W.H. Bath took his place. Captain Bath remained at the mine until August 1st, and was then transferred to the Athens Mine as Assistant Captain.

EXPLORATION.

SURFACE DIAMOND DRILLING.

Hole No. 70, which was started in December 1923, south of the old open pit east of the surface pump-house, was down 128 feet in diorite at the beginning of the year. It was continued in the same material to a depth of 308 feet, and the drill was then moved to Grass Lake below the Lake Sally dam, and was set up on the ice. Hole No. 71 went into jasper at ledge, but found no ore. It was stopped in diorite at a depth of 218 feet. The drill was moved 200 feet north, and Hole No. 72 was put down 186 feet. This hole was in diorite below the ledge. The drill was then moved back to the Salisbury basin, and another hole was drilled, 300 feet north-east of the pump-house, to a depth of 257 feet in diorite. This was the last hole drilled.

REPAIRS TO BUILDINGS.

The shaft-house was repaired, new frames being erected on all four sides inside the old timbers up to the landing-floor, and two pockets were rebuilt.

New hot-water pipes were put in the dry.

ACCIDENT TO EQUIPMENT.

On April 19th at 7:30 P.M. the loaded skip was thrown off the track above the twelfth level, and the rope broke about seventy five feet higher up. The skip was jammed in the shaft, but was uninjured, and hoisting was resumed in two and a half-hours.

SURFACE SUBSIDENCE.

On the night of April 24th the surface south of the East Terrace St. houses caved, but no harm was done either on surface or underground. The cave was extended to the west in the next month. Following this cave-in, a crack appeared in the ground north of East Terrace St. under the east seven houses, breaking the foundations and throwing the walls and floors out of line. Six of these houses were vacant at the end of the year, and the other one had been repaired.

UNDERGROUND.

During the six months that the mine was working the average number of gangs in the Old Mine was eleven, one of which was in rock, and in the South-East Deposit six, all in ore. Some rock-work incidental to stoping was also done in this vein. The average number of gangs stoping was eleven, drifting and raising five, and rock one, seventeen in all.

In the North Vein the ore around old No. 2 shaft near Raises 503 and 505 was entirely mined on the 1240 and 1230 foot sub-levels and the fifth level, and ore lower down in this same territory was mined on both sides of Raise 803 on the 1205, 1195 and 1154 foot sub-levels. Further east in the North Vein, 800 feet south-east of No. 5 shaft, the ore on the 1205 foot sublevel was exhausted, and more than half of that on the 1185 foot sub-level was mined. When the mine closed there were four gangs working on this sub-level.

Below the eighth level two gangs nearly finished the ore in the old workings east of Raise 901 on the 1101, 1095 and 1085 foot sub-levels in the North Vein, and mined all the ore on the ninth level around Raise 1223 in the South Vein. One gang started to open up the pillar around Raise 907, and another was repairing Raise 1021, which had partly caved. Another gang mined a pillar lying on the south foot-wall 100 feet south of Raise 1218 on the tenth level and 1000 foot sub-level, and were opening up a new sub-level in June.

In No. 4 shaft pillar one gang put up a raise 36 feet from the twelfth level, and started to mine the ore on the 960 foot sub-level.

In the South-East Deposit there was some ore left at the east end of the vein on the 905, 895 and 890 foot sub-levels. This was mined down to the thirteenth level. West of Raise "EH" the ore was mined down to the 870 foot sub-level, one sub below the thirteenth level, and the next sub-level was being opened. There were four gangs working on this, the 860 foot sublevel, when the mine closed.

DISMANTLING.

SURFACE.

The trestles, coal-dock, dry and shaft-house were torn down, and the usable material was sold to the Cliffs Shaft Mine. The rope-house, booster pump-house, surface pump-house, shops and office were sold. The office was made into a dwelling-house, but the other buildings were, or are to be torn down. The engine-house, coal-hoist house and barn are in good condition, and are used for storage of machinery.

The mine timber was all sold and shipped to the Holmes Mine, and the coal was loaded and shipped to the Cliffs Shaft Mine. Nearly all the rail, pipe, old cars, trucks, iron and steel, tools, scrap iron, etc. were sold to the Cliffs Shaft Mine for scrap, but the Barnes-Hecker Mine received a good deal of second-hand equipment from underground.

UNDERGROUND.

The pumps were stopped on July 1st, and were taken out as soon as possible. They were stored at the Lake Mine in the dry. The surface centrifugal pump and motor were sent to the General Storehouse, and the boosterpump to the Holmes Mine.

The Cliffs Shaft Mine received the storage-battery locomotive and its charging set, and the Holmes Mine received three Little Tugger hoists and all the drills that were not sent to the Barnes-Hecker Mine. The fan was taken out, and stored at the Lake Mine, and the fan-pipe was sent to the Holmes Mine.

All the rail, pipes, cars, trucks, etc. that were in reasonably good shape, were taken out of the mine, and the cable, water-column and airpipe above the twelfth level were also taken out.

After everything was out of the mine the shaft was thoroughly covered over and the pit and caved ground fenced off.

No watchman is employed.

ANNUAL REPORT OF THE

ANGELINE MINE

(1924)

GENERAL .

The Angeline Mine remained closed throughout the year, and pumping was continued by the Oliver Iron Mining Co. in "D" shaft.

SURFACE.

The old barn and the office and laboratory have been sold and torn down, and the old carpenter shop has been sold. Part of the carriage shed in front of the old barn has also been sold and torn down.

The joiner in the old carpenter-shop was sent to the Morris-Lloyd Mine, and the other machinery was stored at the Lake Mine in the dry.

NO. 56 RAISE.

No. 56 Timber-raise has caved badly, and is apparently entirely blocked. It has caved around the collar, and a new fence has been erected around it for protection.

There has been another subsidence in the caved ground west of No. 56 timber-raise, indicating that more of the workings left open in this pillar have caved in.

Estimate of Ore Reserves.

Developed Ore.

Sub-Level		Angeline Bessemer Tons
1318		4,600
1310		5,300
1290		5,000
1274		1,500
1258		2,300
Tota	1	18,700
Less	10% Mining Loss and 10% Rock	3,700
Net	Total	15,000

A factor of 12 cu. ft. per ton was used. All the ore is near No. 56 raise above the fourth level, and the estimate is the same as in 1921, 1922 and 1923.

The mine has been abandoned, and the amount of ore in sight is not sufficiently valuable to pay the cost of reopening and extraction.

AREAL

ANNUAL REPORT

OF THE

HOLMES MINE

(1924)

PRODUCTION AND SHIPMENTS.

The Holmes Mine worked on double-shift for one week in January, and then went on single shift. It was shut down on February 23rd and on four Saturdays in March on account of shortage of power, and went on a schedule of four days a week at the end of July, and five days a week on December 1st. Shipments were light, and the stock-pile room was pretty well filled at the end of the year. The mine worked 261 days and produced 154,300 tons of all grades, an average of 591 tons per day.

10,392 tons of rock were produced, an average of 40 tons per day.

Factors Used: - Hard Ore - 9 cu. ft. per ton.

Soft Ore - 12 cu. ft. per ton.

Deductions of 10% for loss in mining and 10% for rock were made in calculating tonnage.

CIME Secto

LABOR.

There was no shortage of labor in 1924. The number of men employed was slightly increased, when the Salisbury Mine closed, in order to provide employment for some of the old hands.

There was no change in the wage-rate during the year.

POWER.

Owing to a shortage of electric power the mine was closed on February 23rd and on four Saturdays in March.

ACCIDENTS TO EQUIPMENT.

The rotary converter for the electric haulage burned out in the middle of February, but a spare motor-generator set was installed at night, and was ready for work the next morning, so that there was no delay in the operation of the mine.

On Thursday, October 30th, at one o'clock the south skip was hoisted through the dump, and was jammed in such a way that it could not be lowered until after six o'clock. No ore was hoisted on that afternoon, but hoisting was resumed on Friday morning.

EXTRAORDINARY REPAIRS.

In May and June the boiler used as an air-receiver was repaired, all the tubes being removed and new ends put in.

In September new head-sheaves for the skips were put up, and the smoke-stack on the boiler in the dry was replaced with a new one.

NEW CONSTRUCTION.

A new four-ton top-tram car was built in March for use with the hard ores.

In July a parking-place for automobiles was laid out and fenced, and all cars were required to be parked there.

E AND A. 444. FIRE PROTECTION.

Fire-doors have been erected in the mine so arranged that they can be closed by opening a valve on any level or on surface, thereby immediately stopping the circulation of air. The work of lining the shaft with sheetiron was continued from the collar down to where the timber is wet.

BUILDINGS.

The dry, office and shops were painted and calcimined, and the roofs of nearly all the buildings were given a coat of roofing tar.

MINE TIMBER.

On account of the reduced schedule of operations the requirements of timber were not large, and were partly met by the timber from the Salisbury Mine which was all shipped to the Holmes Mine after the Salisbury Mine had closed down.

WATER.

The flow of water underground has remained normal most of the time, except for a month when the snow melted, but it is entering the mine through cracks in the hanging-wall further west, and causes some trouble in the chutes.

On April 24th the ground on Section 16 property cracked across the ditch where the surface water drains off, and let a large flow of water into the mine at night, so that the skip-pit was filled, and hoisting was delayed until three o'clock the following afternoon. The ditch was dammed further west, and the flow of water in the mine returned to normal in 48 hours. Some changes were made in the Holmes Mine drainage ditch, but a crack appeared here

also in August, and the ditch was dammed off. In October and November a ten inch pipe-line was laid around the end of the stock-piles, replacing the ditch and carrying the surface water away from the cave.

CAVED GROUND.

The subsidence over the Section 16 Mine workings has not extended appreciably in area on Holmes Mine property, but the ground has gone down about ten feet near our south-east corner. The area of the caved ground has been extended to the south and west, however, and has crossed the track leading to the Salisbury Mine. There are cracks in the ground also within fifty feet of the main line of the C. & N.W. Ry. on the west, 250 feet south of the Holmes Mine property line.

SURFACE.

STOCK-PILES.

The Junction Bessemer stock-pile was nearly cleaned up, only about 2,000 tons remaining at the end of the shipping season. A short cut was taken out on the east side of the Junction pile and also on the west side of the Holmes pile. The small pile of Holmes ore that was overcast last year to make room for Holmes Bessemer was shipped this year, and a small cargo was shipped from the overrun pile of Holmes Bessemer near the C. & N.W. Ry. main line tracks. About 8,000 tons remains in this pile, which is in the way of the Junction pile. Enough stocking-room is available for all grades for this season at the present rate of production.

UNDERGROUND

GENERAL.

Up to July 1st the number of contracts was 33, but in July this number was increased to 36, in order to take care of some of the older employees from the Salisbury Mine. The only development undertaken was raising and such drifting as was necessary in opening new sub-levels, except a short cross-cut to the south boundary-line on the 240 foot sub-level, which was driven to make another connection with the Section 16 Mine. Practically all the raising on the third level is finished, and raises are now being put up from the fourth level.

The average classification of contracts was as follows :-

Stoping	21	21 Contracts		
Drifting and Raising in Ore	12	"		
Drifting and Raising in Rock	<u>_1</u>			
Total	34			
Hard Ore Vein	11	Contracts		
Soft Ore Vein	22	H		

There was an increase in the proportion of hard ore mined from 26.4% of total production in 1923 to 30.2% in 1924. The proportion of bessemer ore in the hard ore product decreased again from 73.3% in 1923 to 60.8% in 1924. In the soft ore production, however, the proportion of bessemer ore increased slightly from 23.5% in 1923 to 35.2% in 1924.

In the Hard Ore Vein the softer, slaty ore in the eastern part has been entirely exhausted, and the ore remaining is harder and much more difficult to mine, and is badly mixed with seams of rock. The ore areas as mined, however, are somewhat larger than estimated.

DEVELOPMENT.

Raise 401 was put up in rock at the west end of the mine from the fourth level to the 240 foot sub-level, and in hard ore from the 240 foot sublevel to the third level.

Raise 460 was put up at the south-east end of the mine to the third level, being in rock to the 240 foot sub-level and in ore above that point. Raises 461, 462 and 463 were started in rock, but soon passed into ore, No. 461 being in soft ore and No. 462 in hard ore above the 240 foot sub-level. Raise 463 has not been finished.

Early in the year a cross-cut was driven south 55 feet from the third level drift 15 feet east of Raise 360 into the hanging-wall, and a flat raise was put up in rock to the 340 foot sub-level to take down the water that was coming in through the hanging. This raise is still carrying a large part of the water, but new cracks have developed farther west that have partly drained it.

STOPING.

HARD ORE VEIN.

Stoping has been continued in the Hard Ore Vein between the second and third levels in the same manner as in 1923, that is, in a series of steps rising towards the west from the 310 foot sub-level at a point near where this vein crosses the south boundary-line of the property to the 365 foot sub-level at the west end of the vein at Raise 317. There are twelve contracts working in this vein, distributed as follows:- two each on the 365, 355 and 345 foot sub-levels, one on the 340 foot sub-level, three on the 330 foot sub-level and two on the 310 foot sub-level.

The ore west of Raise 361 is harder than it was higher up, and the western part of the vein is much cut up by seams of rock. Just below the second level the ore does not extend as far west as it did higher up, but further east the area mined is larger than estimated.

SOFT ORE VEIN.

Practically all of the ore has in 1924 been hoisted from the third level, although a little ore was mined early in the year from the second level and above. All of the ore above the second level has been mined except a very small amount close to the cross-cut to the shaft, and this is rather high in sulphur.

At the beginning of the year the 375 foot sub-level had been mined for a distance of 180 feet north of the south boundary and 200 feet west of the east boundary. This sub-level has been finished except for a small area close to the foot-wall under the second level cross-cut. The 365 foot sublevel has also been extensively opened and mined, and there are now thirteen contracts working on it. The work is concentrated along the north foot-wall and in the middle part of the vein.

The 355 foot sub-level has also been mined further west, and is worked out close behind the 375 foot sub-level, and now has two gangs working on it.

The 340 foot sub-level has been worked out east and south of Raise 348. There is a big dike that cuts through the ore 25 feet south of this raise, and all the ore has been mined on this sub-level south of this dike nearly to No. 3 cross-cut. One gang is working here.

On the 330 foot sub-level the ore has been mined for a distance of 300 feet west from the east boundary and 100 feet north of the south boundary, and there are now three gangs working between this area and the foot-wall, the one farthest west being 220 feet from the east boundary.

The ore within 30 feet of the south main drift on the third level has been mined as far west as Raise 357, 280 feet from the east boundary, on the 320 foot sub-level, except a small block east of Raise 354, on which one gang is now working.

Two gangs are working on the 320 foot sub-level, which has been mined as far west as the Hard Ore vein at Raise 355.

The 300 foot sub-level has been finished from the point where the foot-wall crosses the south boundary west to Raise 356, and north from this raise to the foot-wall. One gang is working here.

In 1923 2588 feet cost \$ 8.11 per foot, and in 1924 1974 feet cost \$ 8.38 per foot.

The decrease is in raising in ore.

In 1923 the mine was working two shifts, while in 1924 it worked only one shift.

The decrease is due to only working one shift in 1924.

In 1924 the mine was operated only one shift.

In 1924 five fire-doors were installed in the mine on E & A. 444.

The decrease is mostly in electric power.

The cost of operating the compressor decreased \$ 7498.21 in 1924 on account of only working one shift. Air-pipe extensions decreased \$ 1253.12 in 1924.

The decrease is due to only working one shift in 1924.

NEGAUNEE MINE - 1924.

The product for the year by grades was as follows :-

Bessemer,	47,250	tons,	
Negaunee,	275,873		
Total,	323,123		
Rock,	3,176		

This product is considerably below normal but is due to the fact that from July 29th to December 1st the mine operated on a four-day per week schedule and from December 1st on five days a week.

During the first part of the year our product was in the neighborhood of 32,000 tons per month, whereas previous to 1921 it averaged from 45,000 to 50,000 tons per month. When operating on full time schedule of six days per week, therefore, we are mining only about two-thirds of our normal capacity.

The work during the past year has been on the ninth level and immediately below in the vicinity of the Maas Mine; on the South foot between the ninth and tenth levels near #1 shaft pillar; and in the center of the ore deposit between the tenth and eleventh levels. The principal development work has been in finishing the shaft to the thirteenth level and opening the twelfth level plat. In the latter place work is now in progress.

The work for the year on the various levels and sub levels is as follows:-

UNDERGROUND.

NINTH LEVEL - NORTH FOOT - NEAR MAAS MINE.

When the American Mining Company strip and the supporting pillar in this area were mined, pillars were left on the foot between raises #56 and #48. The expense of mining these at the minth level elevation was prohibitiwe so it was decided to mine them from the 590' sub level by transferring the ore. This territory is extremely wet. The work was started early in the

year and discontinued in May. It was started again and completed in December.

In the East end of the mine a ventilation drift was started in November to hole to the incline raise which extends from the ninth to the tenth levels. This is being continued in December and should be completed early in January.

SUBS BETWEEN NINTH AND TENTH LEVELS.

595' SUB LEVEL - NORTH FOOT.

In the American Mining Company strip and supporting pillar work was in progress during the whole year.

In December there were four contracts to the North and one South of the large dike. All in the supporting pillar.

A timber raise from the 588' sub level to this sub was holed in Recember. This is located in the American Mining Company strip Northeast of #60 raise.

588' SUB LEVEL.

NORTH FOOT.

This was started in January and the development work carried on during the entire year in the American Mining Company strip and supporting pillar.

In December one contract was driving East on the foot wall, one putting up a timber raise to the 595' sub level in the American Mining Company strip, and a third just to the West of #58 raise drifting South through the dike. 580' SUB LEVEL.

SOUTH FOOT.

This sub level, both North and South of #1 dike, was opened in 1923. Mining has been in progress in both areas during the entire year. In the Northwest end of the mine the drift Southeast of #60 raise was repaired preparatory to opening this territory under the hanging on the 595' sub level.

In December five contracts were employed on the South foot between #1 and #2 dikes and four between the foot wall and #1 dike; all of which were stoping.

555' SUB LEVEL.

SOUTH FOOT.

Development was started in January and continued throughout the year. The territory has been opened between #2 dike and the foot wall and mining is in progress in two places, namely, under the hanging West of the vertical winze and South of #2 dike.

In December between #1 and #2 dikes one contract developed East toward #154 raise. Four contracts stoped South of #2 dike while between #1 dike and the foot, one contract is developing East toward #149 raise and another stoping under the hanging just to the West of the winze. TENTH LEVEL.

Early in the year a small territory in the hanging was mined from #244 raise in the West end of the mine.

SUBS BETWEEN TENTH AND ELEVENTH LEVELS.

488' SUB LEVEL.

This sub level, North of #2 dike, was opened in 1922 and mining has continued without interruption to the present time. The entire territory has been mined with the exception of a few pillars in the Northwest end along the hanging in the vicinity of #220 and #244 raises. This sub level should be completed by spring.

In December four contracts were stoping in the territory tributary to #8 and #10 crosscuts, eleventh level. 475' SUB LEVEL.

The development of this sub level North of #2 dike with the exception of the incline stopes, near the North foot and under the hanging, was started in February. The work has been in progress during the entire year.

In December in the territory tributary to #9 and #10 crosscuts, eleventh level, were three contracts stoping; between #210 and #212 raises two contracts developing, one to the Southwest along the dike, the other to the Northwest from #208-A raise.

One contract is developing Northeast from #233 raise.

On the hanging side are twelve contracts stoping and one developing Northeast along #2 dike.

Over #4-A crosscut at the incline stope, one contract took three slices during the month, two of which were to the North and one to the South. 460' SUB LEVEL.

SOUTHWEST END.

Work here was over #4 crosscut at the incline stope where work started late in 1923 and finished in February.

450' SUB LEVEL.

SOUTHWEST END.

Work here was also at the incline stope over #4 crosscut, eleventh level, directly below the area mined on the 460' sub level. Mining started in February and was finished in June.

440' SUB LEVEL.

SOUTHWEST END.

This is in the same territory as mentioned above over #4 crosscut. The work was started in June and finished in December. ELEVENTH LEVEL.

The connecting drift to the Maas Mine, 8' above this level, is being enlarged to standard size. This will be driven to Maas Mine raise #120 and should be finished early in January. It will act as the main air inlet to the Maas Mine when the new ventilation system is started.

In #5 crosscut two raises were started in December. TWELFTH LEVEL.

The pentice in the shaft at this elevation was removed in August. The plat was widened to the East of the shaft in October and in December the pocket excavation started. A small sump was cut at the entrance to the pumphouse.

The development of this level will be pushed during the coming summer.

THIRTEENTH LEVEL.

In June and July the plat was cut and the pumphouse excavated, also a small sump at the entrance to the pumphouse. The pumproom was gunited in December. In September a false bottom was placed in the bottom of the skip compartment and a chute extended to the North to handle the skip pit spillage. SHAFT.

The work at the shaft which had been discontinued during the winter months was resumed in June. One set was placed below the thirteenth level and then the pentice below the twelfth level removed. The casing between the compartments has been completed and the shaft is now in use to the thirteenth level.

UNDERGROUND IN GENERAL.

The mine is in excellent shape for production. During the past few year or since we have been operating on a curtailed output, we have done no mining in the #2 shaft pillar. If a larger monthly production were desired these areas could be opened with little difficulty. During the past year the mining has been the regular top slicing and most of the ore extracted by hand shoveling, however, nine Mayne Loaders and two Tugger Hoists and Scrapers were used. Both of these mechanical devices gave good results. The tons per man per day where these were employed being nearly double that of hand work. MAYNE LOADERS.

During the year nine Mayne Loaders were used on the sub levels. Each loader is operated by two men who also do their own tramming, drilling, blasting and timbering. These eighteen men produced 73,392 tons or 22.4% of the total mine output.

Below is a tabulation showing the results obtained with these loaders:-

LOADER NUMBER	DAYS WORKED	CONTRACT PRICE PER TON LESS THAN OTHER MINERS	INCREASED EARN- INGS PER DAY OVER OTHER MINERS	TONS PER MAN INCREASE OVER AVG. OF MINE	TONS	Tons per Man per Day
2	506	28.6%	15.2%	59.1%	8,484	16.77
3	483	26.6%	15.1%	73.1%	8,588	17.78
4	387	28.3%	17.3%	73.5%	7,032	18.17
5	470	27.4%	21.4%	89.3%	9,344	19.88
6	436	26.8%	20.8%	78.3%	8,364	19.18
7	470	27%	16.6%	77.5%	8,624	18.34
8	411	27.1%	11.5%	61.8%	7,016	17.07
9	444	27.5%	17.7%	80.4%	8,408	18.94
10	377	25.8%	10.7%	66.7%	6,532	17.33
Average	- 1	27.2%	16.3%	74.5%	100	18.17
Total -	3,984		and the second sec	Santan finder and the	72,392	

Average tons per man per day, with loaders, 18.17

While the nine loaders showed an average of 74.5% increase in tons per man per day over the average of miners hand shoveling, #5 loader showed 89.3% for the year with individual months running much higher, January 101%, February 115%, March 114%, May 112% and November 97%.

The ore mined with the loaders was at a saving of from $11\frac{1}{49}$ Tt $18\frac{3}{49}$ per ton to the Company. The 72,392 tons mined, using the average saving of 15 cents per ton, means \$10,858.80. This is figured on 261 operating days, and would have been proportionately larger if the mine had operated at its normal rate of 300 days.

The total maintenance for the year on the nine loaders, labor and supplies, was \$904.15.

These have been used whereever possible. In development work drifts can be driven at double the speed where hand loading is used.

INCLINE SLICING.

In my last two annual reports, I have mentioned a method of mining which we have instituted here and from which we are getting excellent results. This incline slicing was originally started by working from vertical raises spaced at 12' to 15' intervals. At right angles to the line of these raises, the slices were driven for a distance of 35' to 50' laterally. These were driven on an angle of 35° from the horizontal, the idea being that the ore, when blasted from the breast, would slide down the poles placed on the bottom and feed directly into the top of the raises. Good results were obtained by this method, but when the breast was more than 15' from the raise it was found that considerable scraping was necessary to get the ore in the chutes. The angle was not sufficient for the ore to slide into the chutes freely. At this angle, however, it was extremely difficult for the miners to place their sets in the breast as there was a large over-hanging portion in the back and it was awkward to place the cap on the legs. Furthermore, it was a little hazardous as the men had little chance in getting to a place of safety in case loose chunks dropped from the back or breast.

During the past year we have cut the angle of inclination of the slice down to 20° from the horizontal and are using double drum tugger hoists and scrapers for pulling the ore into the chutes. This method has worked very well on the two incline stopes operated this year over #4 and #4-A crosscuts, eleventh level. I think that practically as good results could be obtained if we cut down the inclination somewhat more. Two types of tugger hoists have been used for this work, one is the 6H model of the Ingersoll-Rand Company, the other the Waugh. The latter is made by the Denver Rock Drill Company. Both have given excellent results. We have just received two new Ingersoll-Rand hoists, model 6HC, for slusher work. DEVELOPMENT WORK.

During the coming year the principal development work will be in opening the twelfth level. We are in good shape for this as a drift already

connects #2 shaft with the vertical winze from the twelfth to the tenth levels inside of the mine. This should help in our ventilation problem. One of the first drifts driven will be to connect with the Maas Mine, which will help materially in the ventilation of both mines. VENTILATION.

During July it was found from tests that the air in the Negaunes Mine was deficient in oxygen and high in carbon dioxide. The Maas Mine showed a more serious condition. The two mines are connected. It was therefore necessary to consider both mines in arriving at a method for improving the air conditions. A careful study was made and it was decided to install a blower fan at the collar of #2 shaft Negaunes and to split the air so that it would give proper ventilation to both mines. Very little underground work is required at the Negaunes Mine for proper forced ventilation. A short drift is being driven on the ninth level and air locking doors for the motor trains will have to be installed on the ninth, tenth and eleventh levels and later on the twelfth level. Auxiliary fans will be used where necessary when opening new sub levels.

SHAFT REPAIRS.

During the spring, it was necessary to place new brackets for the cage runner supports. The rivets holding the original brackets had enlarged the holes and made the support insecure. FIRE DOORS.

Fire doors have been installed on the ninth, tenth and eleventh levels near #3 shaft. These are controlled by valves located at each plat and also on surface. The opening of any one of these valves immediately closes all doors.

WATER.

The average number of gallons of water pumped per minute during the year as compared with 1923 is as follows:-
